PHP CODE OR LOGIC THAT HANDLE THE PRIMARY API INTEGRATION

The Logic (The "Digital Translator")

1. Catch the Message: The pharmacy computer sends a "packet" of data (called JSON). It's like a digital envelope.
2. Open the Envelope: The PHP code opens this envelope and pulls out the raw details (Pharmacy Name, Medicine, and Quantity).
3. Clean it Up: The code makes sure the names are spelled correctly and the numbers are actual numbers, so the website doesn't get confused.

```
<?php
// 1. Capture the "Digital Envelope" sent by the pharmacy
$envelope = file_get_contents("php://input");

// 2. Translate the envelope into a list the website
understands
$report = json_decode($envelope, true);

// 3. Extract the specific "news" from the report
$pharmacy = $report['pharmacy_name']; // "Pharmacy A"
$medicine = $report['medicine'];    // "Paracetamol"
$stock    = $report['current_stock']; // 5

// 4. Now the code is ready to show this on the website
echo "System received a report from $pharmacy:
$medicine is now at $stock units.";
?>
```

TARGET USERS :

Basud Residents & Patients

Local Pharmacy Owners (MSMEs)

Local Pharmacists & Pharmacy Staff

Municipal Health Officers (MHO) / Basud LGU

FEATURES:

- ♥ Unified Search Engine: This feature allows patients to find specific medications instantly by scanning a consolidated database of every connected pharmacy in the area.
- ♥ Real-Time Stock Synchronization: The system automatically reflects current inventory levels by instantly updating the website whenever a sale is processed at a pharmacy counter.
- ♥ Pharmacy Mapping: An integrated map guides users to the location of pharmacy with available stock.

THANK YOU
FOR YOUR ATTENTION
